                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AND SOLUBLE/SNRP1; THE EXPRESSION OF MEMBRANE-BOUND AND SOLUBLE/SNRP1; THE EXPRESSION OF MEMBRANE-BOUND AND SOLUBLE/SNRP1 ISOFORMS DOES NOT SEM TO OVERLAD. THE MEMBRANE-BOUND AND SOLUBLE/SNRP1 ISOFORMS DOES NOT SEM TO OVERLAD. THE MEMBRANE-BOUND ISOFORM IS EXPRESSED BY THE BLOOD VESSELS OF DIFFERENT TISSUES. IN THE DEVELOPING EMBRYO IT IS FOUND PREDOMINANTLY IN THE NEWYOUS SYSTEM. IN ADULT TISSUES, IT IS HIGHLY EXPRESSED IN HEART AND PANCREAS; AND LOW IN ADULT BRAIN. THE SOLUBLE/SNRP1 ISOFORM IS FOUND IN LIVER HEPATOCYTES, KIDNEY DISTAL AND PROXIMAL TUBULES.
-!- SIMILARITY: OCNTAINS 2 CUB DOMAINS.
-!- SIMILARITY: CONTAINS 2 FS/8 TYPE C DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. CERDIOVASCULAR SYSTEM, IN ANGIOGENESIS, IN THE PORMATION OF CARDIOVASCULAR SYSTEM, IN ANGIOGENESIS, IN THE PORMATION OF CERTAIN NEURONAL CIRCUITS AND IN ORGANOGENESIS OUTSIDE THE NERVOUS SYSTEM. IT MEDIATES THE CHEMOREPULSANT ACTIVITY OF SEMAPHORINS. IT STEPS TO SEMAPHORIN 3A, THE PLGF-2 ISOPORM OF PGF, THE VEGF-165 ISOPORM OF VEGF AND VEGF-B. COEXPRESSION WITH KOR RESULTS IN INCREASED VEGF-165 BINDIA TO KDR AS WELL AS INCREASED CHEMOTAXIS.

CIT MAY REGULATE VEGF-INDUCED ANGIOGENESIS (BY SIMILARITY).

CIT SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

CIT SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

CIT SIMILARITY: BELONGS TO THE NEUROPILIN FAMILY.

CIT SIMILARITY: CONTAINS 2 FG/B TYPE C DOMAINS.

CIT SIMILARITY: CONTAINS 2 FG/B TYPE C DOMAINS.

T "Developmentally regulated expression of a cell surface protein,

The moure pilin, in the mouse nervous system...;

J. Neurobiol. 29:1-17(1996)

C. I- FUNCTION: RECEPTOR INVOLVED IN THE DEVELOPMENT OF THE

CARDIOVASCULAR SYSTEM, IN AMGIOGENESIS, IN THE FORMATION OF

CERTAIN NEURONAL CIRCUITS AND IN ORGANOGENESIS OUTSIDE THE NERVOUS

SYSTEM. IT MEDIATES THE CHEWOREPULSANT ACTIVITY OF SERAPHORINS. IT

BINDS TO SEMAPHORIN 3A, THE PLGF-2 ISOFORM OF PGF, THE VEGF-165

INCREASED VEGF-165 BINDING TO KDR AS WELL AS INCREASED CHEMOTAXIS.

C. I SUBCELLUIAR LOCATION: TYPE I MEMBRANE PROTEIN.

C. I SIMILARITY: CONTAINS 2 CUB DOMAINS.

C. ISTAILARATTY: CONTAINS 2 EVB BYPE C DOMAINS.

C. ISTAILARATTY: CONTAINS 2 FS PROMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. SUBUNTI: NETROPILIN-2 PROBABLY FORMS AN HETEROMERIC COMPLEX WITH
NEUROPILIN-1 IN ORDER TO BE A FUNCTIONAL SEMAPHORIN E RECEPTOR.
SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: 6 ISOPORAS; A22 (SHOWN HERE), A0, A5, A17,
BO AND B5; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: EXPRESSED IN DEVELOPING CNS, PNS AND IN SOME
NONNEURAL TISSUES INCLUDING LIMB BUDS, DEVELOPING BONES, MUSCLES,
INTESTINAL ENTHELLUM, KIDNEY, LUNG AND SUBMANNIBULAR GLAND.
IS DEVELOPMENTAL STAGE: THE EXPRESSION PATTERN IS VERY DYNAMIC AND

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       c vegf4 or fragments thereof, particularly human zvegf4/human zvegf4 or fragments thereof, particularly human zvegf4/human zvegf4 or fragments thereof, particularly human zvegf4/human zvegf4 cucleic acids; the recombinant expression of human zvegf4 an antibody which binds to human zvegf4 are a method of activating a cell-surface PDGF receptor using a zvegf4-derived polypeptide; a method of modulating the proliferation, differentiation, migration or metabolism of bone cells, comprising exposing bone cells genetic zvegf4-derived polypeptides; and a method of detecting a genetic zvegf4-derived polypeptides; and a method of detecting a genetic zvegf4-derived polypeptides; and a method of detecting a genetic zvegf4-derived polypeptides; and a method of detecting a genetic fragments may be used to stimulate tissue development or repair, or cellular differentiation or proliferation. They are particularly used for the treatment or repair of liver damage, and may also be used to modulate neurite growth (e.g., in the treatment of Alzheimer's disease or multiple sclerosis). Due to their osteogenic activity, they may also be used in the treatment of periodontal disease and fractures. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to the human growth factor homologue zvegf4 (AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4 is a member of the PDGF (platelet-derived growth factor)/YEGF (vascular endothelial growth factor) family. Zvegf4 has a growth factor domain (ABA88654) characterised by a PDGF cystine knot structure, and a CUB domain characterised by a PDGF cystine knot structure. Zvegf4 has PDGF-like activity, having mitogenic activity on fibroblasts, vascular smooth muscle cells and pericytes, and has also been shown to stimulate bone growth. The invention also relates to fusion proteins comprising human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used to enhance expansion and mobilisation of haematopoietic stem cells and endothelial precursor stem cells, which may be useful in the treatment of ischaemia, in wound healing, and in the modulation of the immune system. The present sequence represents mouse zvegf3.
                                                                                                                       factor homologs and the nucleic acids that encode them, useful
                                                                                                                                                                               e.g. for treating liver damage, ischemia, multiple sclerosis and Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 130-131; 143pp; English.

nurine 2VEGF3 are claimed. The growth factors comprise a growth factor domain and a CUB domain (generic sequence motifs are shown in AAY96859 and AAY96860). The growth factor domain is characterized by an arrangement of cysteine residues and beta-strands that is characteristic of the "cysteine knot" structure of the platelet-derived growth factor (bGF) family. The CUB domain shows homology to CUB domains in neuropilins, human bone morphogenetic protein-1, porcine seminal plasma crotein, bovine acidic seminal fluid protein and Xenopus laevis tolloid-like protein. Structural analysis and homology predict that zVEGF3 polypeptides complex with a second polypeptide to form multimeric proteins. The human zvegf3 gene has been mapped to chromosome 4q28 3.

ZVEGF3 polypeptides complex with a second polypeptide to form multimeric proteins. The human zvegf3 gene has been mapped to chromosome 4q28 3.

ZVEGF3 is useful for stimulating the growth of fibroblasts or smooth muscles cells, for activating cell surface PDGF-alpha receptor and for inhibiting PDGF-alpha receptor mediated cellular processes. ZVEGF3 is useful for regulating (post-development) organ growth, regeneration and maintenance as well as tissue maintenance and repair processes. ZVEGF3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel zveqf3 polypeptides and nucleotides encoding them useful for stimulating growth of smooth muscle cells and fibroblasts comprising an epitope bearing portion of a specific amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease, myocardial ischemia, vascular intimal hyperplasia, atherosclerosis, wound healing, chronic liver disease and heamangioma atherosclerosis, wound shealing, chronic liver disease and heamangioma formation. ZVEGF3 can also be used to modulate neurite growth and development of the nervous system, and for treating neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This shows a murine ZVEGF3 a novel vascular endothelial growth factor

and/or growth or motility of cells expressing a PDGF-C receptor.

PDGF-C polypeptides can be used in pharmaceuticals for promoting cell
proliferation, preferably in combination with one other growth factor
and heparin. Pharmaceuticals comprising PDGF-C polypeptides can also
be used for stimulating connective tissue or wound healing. The
PDGF-C polypeptide can be enzymatically processed to generate the active
truncated form of PDGF-C and used to regulate the receptor-binding
specificity of PDGF-C. PDGF-C can also be used to promote fibroblast
mitogenesis in a mammal and to induce PDGF alpha receptor activation.
PDGF-C antagonists can be used to inhibit tumour growth of a tumour
CC expressing PDGF-C in a mammal. Specific types of human tumours, e.g.
choriocarcinoma, Wilms tumour, megakaryoblastic leukaemia, lung carcinoma
and erythroleukemia, can be identified by testing for expression of
PDGF-C. PDGF-C antagonists can also be used to inhibit tissue
remodelling during invasion of tumour cells into a normal population of
cells, Antagonists can also be used to inhibit conditions,
                                                                                                                                                                                                                      especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAB01427;

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has valinaray, cytostatic, antirheumatic, antirheumatic, antirheumatic, antirheumatic, antirheumatic, antirheumatic, antiporiatic and ridiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair psy promoting angiogenic activity or vascularization. This sequence repairs the human VEGF-X protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiathritic; antipsoriatic; antidabetic; tradiment; anglogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
    rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      247 LYSCTPRNFSVSIREELKRTDTIFWPGCLLVKRCGGNCACCLHNCNECQCVP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postriasis, inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's chronic myelogenous leukemia, cancer, liver disease, Hodgkin's chiseases e.g. myasthemia gravis, autoimmune diseases e.g. myasthemia gravis, autoimmune disbetes and systemic clupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, copnostic assays, prognomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, extostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  kin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-X protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, gytostatic, antinhemmatic, antinhemical antipocriatic and antidabetic activity and acts as a nangiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating corp reventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote tissue regeneration and organ repair, proliferation of new blood vessels, tissue regeneration and organ repair, by promoting angiogenic activity or vascularization. This sequence represents a human VEGF-X protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VEGE-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; anglogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                                                                                                                                                                                                                                                             preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, oylostatic, antinheumatic, antiarthritic, antipheumatic, antiarthritic, antipheumatic, antipheumatic, antipheumatic, antipheumatic, antipheumatic, antipheumatic, antipheumatic, antipheumatic, and vascularization and acts as an angiogenesis and vascularization crequiator. An antisense molecule of the invention is useful for treating cancer, rheumaticid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and itssue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence repersents a human VEGF-X protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Platelet-derived growth factor C; PDGF-C; cell proliferation; growth factor; heparin; connective tissue; wound healing; VBGF-F; fibroblast mitogenesis; PDGF alpha receptor activation; tumour growth; choriocarcinoma; Wilms tumour; megakaryoblastic leukaemia; lung carcinoma; erythroleukemia; tissue remodelling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and/or growth or motility of cells expressing a POGF-C receptor.

DGF-C polypeptides can be used in pharmaceuticals for promoting cell
proliferation, preferably in combination with one other growth factor
and heparin. Pharmaceuticals comprising POGF-C polypeptides can also
be used for stimulating connective tissue or wound healing. The
POGF-C polypeptide can be enzymatically processed to generate the active
truncated form of POGF-C and used to regulate the receptor-binding
truncated form of POGF-C and used to regulate the receptor-binding
pecificity of POGF-C. POGF-C can also be used to promote fibroblast
mitogenesis in a mammal and to induce POGF alpha receptor activation.
POGF-C antagonists can be used to inhibit tumour growth of a tumour
corpressing POGF-C in a mammal. Specific types of human tumours, e.g.
choriocarcinoma, Wilms tumour, megakarryoblastic leukaemia, lung carcinoma
and erythnoleukemia, can be identified by testing for expression of
POGF-C. POGF-C antagonists can also be used to inhibit tissue
remodelling during invasion of tumour cells into a normal population of
cells. Antagonists can also be used to treat fibrotic conditions,
especially found in the lung, kidney or liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The proteins may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases. Polynucleotide sequences AAF18425 - AAF18433 and peptide AAB58549 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lung cancer associated gene sequences, referred to as lung cancer antigens, useful for treatment, prevention, and diagnosis of disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antagonists may have neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antilinfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58106 - AAB58548. Lung cancer associated proteins and polynucleotide sequences, their agonists, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer,

This invention describes the isolation of a novel human vascular endothelial cell growth factor-E (VEGF-E) polypeptide which has cranquillizer, vulnery and cardiant activity. VEGF-E can be administered therapeutically, especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially humans. It is useful in wound repair and tissue generation and regeneration, and may especially be used to treat cardiac hypertrophy it can be combined with a carrier in pharmaceutical compositions, which can be administered to treat disorders as above. VEGF E can be used to screen for antagonists, and aponists, and the antagonists administered to treat angiogenic disorders in mammals (especially humans) e.g. cancer or serul therapeutically as antagonists, as above. The antibodies are also useful to detect VEGF-E polypeptide, especially to diagnose cardiovascular, endothelial or angiogenic disorders in mammals (e.g. vascular disease, or neovascularization associated with tumor formation of an antibody vegef-E polypeptide complex. Polynucleotides encoding vegef-E can be used to diagnose cardiovascular and endothelial disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in mammals, by detecting abnormally high or low VEGF-E gene expression in tissue samples. They can also be used to diagnose a disease or susceptibility to a disease related to a mutated form of VEGF-E (e.g. a cardiovascular, endothelial or angiogenic disorder such as a tumor), by detecting a mutation in the VEGF-E-encoding sequence isolated from a
                    treatment; cardiovascular disorder; endotĥelial disorder; therapy; tissue generation; regeneration; cardiac hypertrophy; cancer; detection; angiogenic disorder; age-related macular degeneration; vascular disease; neovascularization; tumor; gene mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sample. They may also be used to produce probes useful to detect related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene mapping. This sequence represents the human VEGF-E in the method of the invention.

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA234891 to AA234338, and AA141685 to AA41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular

                                                                                                                                                                                                                                                                                                                                                                                                                                                            related (VEGF-R) protein. VEGF-R can be used in assays to identify compounds that bind to it or that unragonize its activity. VEGF-R antiaponists (e.g. anti-VEGF-R antibodies) are useful for inhibiting tissue growth. This is useful for inhibiting tumour growth and for treating cancer. VEGF-R itself can be used to stimulate tissue growth, angiogenesis and to traat coronary artery blockage. The VEGF-R coding sequence can be used for the recombinant production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                  growth factor

nucleic acids; the recombinant expression of human zvegf4; an antibody which binds to human zvegf4 or a fragment thereof; a method of activating a cell-surface PDGF receptor using a zvegf4-derived polypeptide; a method of modulating the proliferation, differentiation, migration or metabolism of bone cells, comprising exposing bone cells to zvegf4-derived polypeptides; and a method of detecting a genetic abnormality in the zvegf4 gene of a patient. Zvegf4 proteins and derived abnormality in the zvegf4 gene of a patient. Zvegf4 proteins and derived cellular differentiation or proliferation. They are particularly used for the treatment or repair of liver damage, and may also be used to modulate neurite growth (e.g., in the treatment of Alzheimer's disease or multiple sclerosis). Due to their osteogenic activity, they may also be used in the treatment of periodontal disease and fractures. They may also be used to net the activity and mobilisation of haematopoietic stem cells and endothelial precursor stem cells, which may be useful in the treatment of ischaemia, in wound healing, and in the modulation of the immune system. The present sequence represents human zvegf3.
liver damage; neuroregenerative; Alzheimer's disease; multiple sclerosis; periodontal disease; bone fracture; wound healing; vulnerary; ischaemia; immunomodulation; hepatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4.is a member of the PDGF (platelet-derived growth factor)/VBGF (vascular endothelial growth factor) family. Zvegf4 has a growth factor domain (AAB48654) characterised by a PDGF cystine knot structure, and a CUB domain (AAB48655) which has a beta barrel structure. Zvegf4 has PDGF-like activity, having mitogenic activity on fibroblasts, vascular smooth muscle cells and pericytes, and has also been shown to stimulate bone growth. The invention also relates to fusion proteins comprising human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Growth factor homologs and the nucleic acids that encode them, useful e.g. for treating liver damage, ischemia, multiple sclerosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MONOOXYGENASES. IN LIVER MICROSOMES, THIS ENZYME IS INVOLVED IN AN NADPH-DEPENDENT ELECTRON TRANSPORT PATHWAY. THIS ISOZYME IS ACTIVE UPON P. NITROANISOLE, ANILINE, D-BENZPHETAMINE, DELTA(9).

FETRAHYDROCANNABINOL (THC) AND STRYCHNINE.

CATALYTIC ACTIVITY: RH + REDUCED FLAVOPROTEIN + O(2) = ROH + OXIDIZED FLAVOPROTEIN + H(2).

SUBCELLULAR LOCATION: MEBRANE-BOUND. ENDOPLASMIC RETICULUM.

SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Eur. J. Biochem. 223:203-210(1994).

Eur. J. Biochem. 223:203-210(1994).

- FUNCTION: PLATELET FACTOR 4. NONCOVALENTLY BOUND TO A PROTEOGLYCAN MOLECULE. IS RELEASED DURING PLATELET AGGREGATION. PF4 NEUTRALIZES THE ANTICOAGULANT EFFECT OF HEPARIN BECAUSE IT BINDS MORE STRONGLY TO HEPARIN THAN TO THE CHONDROITIN-4-SULFATE CHAINS OF THE CARRIER MOLECULE. CHEMOTACTIC FOR NEUTRAPHILS AND MONOCYTES.

- SUBUNIT: HOMOTETRAMER.
- PROTEORY OF GAL-GALNAC DISACCHARIDE WHICH IS MODIFIED WITH SIALIC ACID RESIDUES (MACROHETEROGENEITY).

- SIMILARITY: BELONGS TO THE INTERCRINE ALPHA FAMILY (SMALL CYTOKINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                         Maeno M., Xue Y., Wood T.I., Ong R.C., Kung H.F.;

"Cloning and expression of cDNA encoding Xenopus laevis bone morphogenetic protein-1 during early embryonic development.";

Gene 134:257-261(1993).

-!- FUNCTION: INVOLVED IN PATTERN FORMATION IN GASTRULA AND LATER DIFFRERENTATION OF DEVELOPING ORGANS.

-!- DEVELOPMENTAL STAGE: BLASTULA, ERRLY GASTRULA AND LATE GASTRULA.

-!- SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.

-!- SIMILARITY: CONTAINS 3 CUB DOMAINS.

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M12A (ZINC METALLOPROTEASE); ALSO KNOWN AS THE ASTACIN SUBFAMILY.
                                                                                                                                                       Xenopus laevis (African clawed frog).

ENDOPEPTIDASE ENHANCER PROTEIN.
TISSUE SPECIFICITY: AT HIGH LEVELS IN EMBRYONIC MATERNAL DECIDUUM
AND FLOOR PLATE REGION OF THE NEURAL TUBE. LESS IN DEVELOPING
MEMBRANOUS AND ENDOCHONDRAL BONE, SUBMUCOSA OF INTESTINE, DERMIS
OF SKIN AND THE MESENCHYME OF SPLEEN AND LUNG.
SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.
SIMILARITY: CONTAINS 5 CUB DOMAINS.
SIMILARITY: BELONGS TO PEPTIDASE FAMILY M12A (2INC
METALLOPROTEASE); ALSO KNOWN AS THE ASTACIN SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CUB 3.

Dowds C.A., Burks D.J., Saling P.M.;
M. CDNA encoding part of a novel putative receptor tyrosine kinase.";
Submitted (JAN-1996) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Q.
                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TYROSINE PHOSPHATE.

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (BY SIMILARITY).

-!- TISSUE SPECIFICITY: SEEMS TO BE EXPRESSED PREDOMINANTLY IF NOT

EXCLUSIVELY IN THE MONOCYTIC LINEAGE.

-!- DEVELOPMENTAL STAGE: EXPRESSED DURING MOST, IF NOT ALL, STAGES OF

EMBRYOLOGICAL DEVELOPMENT BEGINNING IN THE MORULA AND BLASTOCYST

AND PROGRESSING THROUGH THE YOLK SAG AND FETAL LIVER STAGES.

-!- SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                             01-0CT-2000 (Rel. 40, Last sequence update)

Machotida Sequence of the genomic RNA of hepatitis C virus isolated from a human carrier: comparison with reported isolates for conserved and divergent regions. ").

Gen. Virol. 72:2697-2704(1991).
L. J. Gen. Virol. 72:2697-2704(1991).
C -!- FUNCTION: THE SMALL PROFEINS NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C --- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPETIN M AND GLYCOPROTEIN E. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN C AND MRNA.
